

Android hide apps in secure folder

Continue

1 Install **AirDroid** on your Android. **AirDroid** is a free app that lets you access your Android screen from your computer. This means you can update Android apps through the Play Store just as you would if you were using the phone's touch screen. The app is free from the Play Store, although some features (not the one you need right now) require a premium subscription. The app has a green icon with a white paper airplane inside, and the developer is Sand Studio. You will need to connect your Android to your PC or Mac with a USB cable to use this method. 2 Enable USB Debugging on your Android phone or tablet. You'll only need to do this once. This allows you to connect your Android to your computer via USB. Open Settings and tap About phone or About tablet.[1] Tap Software information. Tap Build number 7 times (quickly) until you see the message that says "Developer mode is enabled." Return to the Settings main screen and tap Developer options. If the switch is not enabled, tap it to enable it now. Slide the "USB debugging" switch to the On position. Tap About phone or About tablet. 3 Create an AirDroid account. To do so: Go to in a web browser. Enter your email address and create a password. Type a nickname for your account. Click Next to send a confirmation code to yourself via email. Copy the confirmation code in the email from AirDroid and paste it into the "Enter verification code here" field. Click Verify and sign up. 4 Install AirDroid for Windows or macOS. Now that you have an account, scroll down and click the Download link below your operating system to download the AirDroid installer. Once downloaded, double-click the installer to run, and then follow the on-screen instructions to complete the installation. If you're using Google Chrome as your web browser and prefer to use a web-based version of AirDroid, you can click Start under "AirDroid Web" instead to install the Chrome AirDroid extension. Once installed, you can access AirDroid on the web at . The remaining steps will be a little different for the web version, but not too different. 5 Log in to AirDroid on your Android. Downloading the app earlier added a new green-and-white paper airplane icon to your app drawer. Tap it to launch AirDroid, and then enter your login information to sign in. 6 Enable Remote Control on your Android. The first time you set up AirDroid, you'll be prompted to set up Security & Remote Features. Here's how to enable Remote Control: Tap OK to set up Security & Remote Features. Tap Remote Control near the bottom of the list. Tap the green Enable Permissions button at the bottom of the screen. \*Tap OK on the pop-up message to close it. In the future, you can enable and disable this feature in AirDroid by tapping the Me tab and navigating to Security & Remote Features > Remote Control. 7 Log in to AirDroid on your PC or Mac. To do this, open the new AirDroid app in the Start menu (PC) or in the Applications folder, and then enter your login credentials. Once you're signed in, you'll see your Android listed under "My devices." If you don't see your Android in the list, make sure it's connected to the same Wi-Fi network as your computer, and that the app is open.[2] 8 Start a Remote Control session. You'll need to do this every time you want to start a new remote control session. Here's how you'll do it: On the PC or Mac version of AirDroid, click the binoculars icon in the left column. This opens the Remote Control panel. [3] Click Start Non-Root authority on the computer. Connect your Android to the computer with your USB charging cable. Plug the larger USB end into an available USB port on your computer. In a moment, you should see a pop-up message on your Android. Tap Ok on the Android to enter debugging mode. If prompted to select a USB configuration on your Android, select Charging only. Follow the on-screen instructions on your Android to start the remote connection. Once you approve the connection, you will see your Android's home screen in the AirDroid window on your computer. If the remote session doesn't start automatically, click the binoculars icon again, and then click Connect under your Android. 9 Use your computer to open the Play Store app on your Android. Using your mouse in the same way you'd tap with your finger, click the Play Store icon, which looks like a sideways multicolored triangle. It'll be in your app drawer. 10 Click the menu ☰. It's at the top-left corner of the Play Store. A menu will expand. 11 Click My apps & games on the menu. It's the first menu option. This displays a list of apps on your Android that have updates available. 12 Tap Update all to update all apps at once. It's the green button near the top-right corner of the list. If you prefer, you can just tap Update next to an individual app to update it instead. When you are finished updating your apps, you can close the connection by closing the AirDroid window on your computer, and/or by closing the AirDroid app on your Android. In the future, just open AirDroid on both your Android and your computer, connect the two via USB, and click the binoculars to start a new connection. Advertisement On this page Sensitive data is easily moved in or out of Secure Folder using features implemented into Android by Samsung. Contents moved into Secure Folder are protected under the Samsung Knox security platform. You can move private files and data easily with the Move to Secure Folder menu which is implemented in native Samsung apps. Select file(s) > Tap [ : ] > Tap Move to Secure Folder. Unlock Secure Folder (User Authentication).If Secure Folder is unlocked, files are moved immediately. When Selected file(s) move to Secure Folder, they disappear from the regular Gallery. NOTE – Data synced to the Samsung cloud may re-appear inside the Gallery app even if you move it to the Secure Folder. If you do not want the data to re-appear inside the Gallery app, ensure you also remove it from the Samsung cloud storage. NOTE – The Move to Secure Folder menu is available on My Files, Gallery, Voice Recorder, Contacts. These settings may vary depending on device and OS version. Move out of Secure Folder You can easily retrieve moved file(s) in Secure Folder with Move out of Secure Folder menu option. Select file(s) > Tap [ : ] > Tap Move out of Secure folder. File(s) are movedMoved file(s) will disappear from the Gallery in Secure Folder. Share via to Secure Folder (Outside – Inside) You can easily move files in and out of Secure Folder using the Share via menu option. Select file(s) > Tap Share > Choose Secure Folder. Unlock Secure Folder (User Authentication).If Secure Folder is unlocked, the Secure Folder share sheet will be shown immediately. Choose an app to share in Secure Folder. Share via to Secure Folder (Outside – Inside) You can easily share file(s) from Secure Folder to your personal side. Select file(s) > Tap Share > Tap More apps. Choose the app you would like to share out of Secure Folder. NOTE – The maximum number of shared files you can send at once is 20. Shared files can't exceed 50MB. ; Add files to Secure Folder You can easily import or copy personal file(s) in Secure Folder with the Add files menu option. This is provided on the top of Secure Folder main screen. Tap Add files. Choose a data type to add to Secure Folder.You can share the following data: Image, Video, Audio, Document, My Files. Choose Copy or Move.Copy: A duplicated file will be saved in Secure Folder.Move: The original file will be moved in Secure Folder. NOTE – Data synced to the Samsung cloud may re-appear inside the Gallery app even if you move it to Secure Folder. If you do not want the data to re-appear inside the Gallery app, ensure you also remove it from the Samsung cloud storage. Robert Triggs / Android AuthoritySamsung Secure Folder is an encrypted space on your smartphone to store files, images, videos, and apps for your eyes only. The service keeps all your sensitive files private, giving you peace of mind that other people won't see these things while using your device.Originally launched as part of Samsung Knox, Samsung Secure Folder comes pre-installed on many of Samsung's modern smartphones. You can also find the app on the Play Store, compatible with any Samsung device running Android 7.0 Nougat or higher. How to set up Samsung Secure FolderBefore you do anything else, you'll need a Samsung account to set up and use Samsung Secure Folder. You can create it here for free if you don't already have one.If you own a newer Samsung phone, Samsung Secure Folder should be pre-installed on your device. Open the app drawer, locate the app, and launch it. Then sign in with your Samsung account, choose the authentication method you want (fingerprint, PIN code, pattern), and you're good to go. Read next: Samsung Galaxy S21 vs S20 Series – Is it worth upgrading? You may have to enable the service first by going to Settings > Lock screen and security > Secure Folder on some devices. Then sign in and choose the authentication method you want to use, and the Samsung Secure Folder icon will show up in the app drawer and on your home screen.If the app doesn't come pre-installed on your device, you'll have to get it from the Play Store. Hit the button below, download Secure Folder, and follow onscreen instructions to set it up. Remember, it's only compatible with Samsung phones running Android Nougat or higher. How to add files and apps to Samsung Secure Folder There's more than one way to add files to Samsung Secure Folder. The easiest way is within the app. It's incredibly straightforward, and here are the steps you'll need to master: Launch the Samsung Secure Folder app. Tap the Add files option on top of the screen. Choose whether you want to add images, videos, documents, or audio. Select the files you want to add to Samsung Secure Folder and tap Done. Select whether you wish to copy or move the files. The second option is to move data to Secure Folder from Samsung's native apps – My Files, Gallery, Voice Recorder, and Contacts. It's another simple method, and it works a bit as if you were using the app itself. Simply follow these steps: Launch one of Samsung's native apps – My Files, Gallery, Voice Recorder, or Contacts. Choose the files you want to move to Secure Folder. Tap the More option on top – the icon with three vertical dots. Select the "Move to Secure Folder" option. Log in to the app to finish the process. There are also a few different ways to add apps to Samsung's service. You can add them just like you would add other files or images, which takes seconds. Don't forget that you can duplicate apps on Samsung devices, allowing you to log into two separate profiles simultaneously. From the app launcher: press and hold an app and select the "Add to Secure Folder" option. How to back up and restore Samsung Secure Folder data The Backup and restore feature comes in handy if you switch to a new phone. It lets you backup all the files located in Samsung Secure Folder to the cloud and then download them to a different device. If you have auto-backup turned on, the phone will back up Secure Folder every 24 hours — when it's charging and connected to a Wi-Fi network.If you don't have auto-backup turned on, here are the steps you'll need instead: Open the settings menu on your device. Choose the Backup and restore option. Select Back up Secure Folder data or Restore. Select the data you want to back up or restore (photos, apps, documents, etc.). Tap Back up now or Restore now to finish the process. To delete a backup you've made, go to Settings > Backup and restore > Delete Secure Folder backup data, select the backup you want to get rid of, and tap Delete. How to hide Samsung Secure Folder on your device and change the icon You can hide the Samsung Secure Folder app on your device for an added safety measure. All you have to do is sign into the app, open the settings via the menu icon (three vertical dots), and turn off the Show Secure Folder option. After that, the app will leave the app drawer and your home screen, but it will stay on the device. Alternatively, you can also hide the app by dragging down the quick panel and tapping the Secure Folder icon. See also: The best Samsung phones at all price pointsYou can also customize the icon if you're not happy with how it looks. Launch Samsung Secure Folder, tap the menu icon on top (three vertical dots), and select the "Customize icon" option. Then choose a new icon from the list and change the name of the app if you want. Keep in mind the new icon and name may not show up in the quick panel and the device's settings, but you'll see them in the app drawer and on your home screen.At this point, we've covered just about all that Samsung Secure Folder can do. Hopefully, we've helped you secure your data because our phones are locked up like Fort Knox!
